

# Method 1: Implicit List

## ■ For each block we need both size and allocation status

- Could store this information in two words: wasteful!

## ■ Standard trick

- If blocks are aligned, some low-order address bits are always 0
- Instead of storing a separate flag
- When reading size, the flag is also read

Assignment Project Exam Help

Add WeChat edu\_assist\_pro

*Format of  
allocated and  
free blocks*

a = 1: Allocated block

a = 0: Free block

Size: block size

Payload: application data  
(allocated blocks only)

# Header Example

- **Size = 16, allocation status = 1**

- 16 = 00010000

- **Need to “zero out” the LSB to get the size**

- **-2 = 11111110**

- Least significant bit is 0

- **Bitwise AND with -2 sets LSB to 0**

# Add WeChat edu\_assist\_pro

# Allocated

## Free blocks: unshaded

**Headers: labeled with size in bytes/allocated bit**
