

Implementation Issues

- How do we know how much memory to free given just a pointer?

- How do we keep track of the free blocks?

<https://eduassistpro.github.io/>

- What do we do with the extra space allocating a structure that is smaller than the one it is placed in?

- How do we pick a block to use for allocation -- many might fit?

- How do we reinsert freed block?

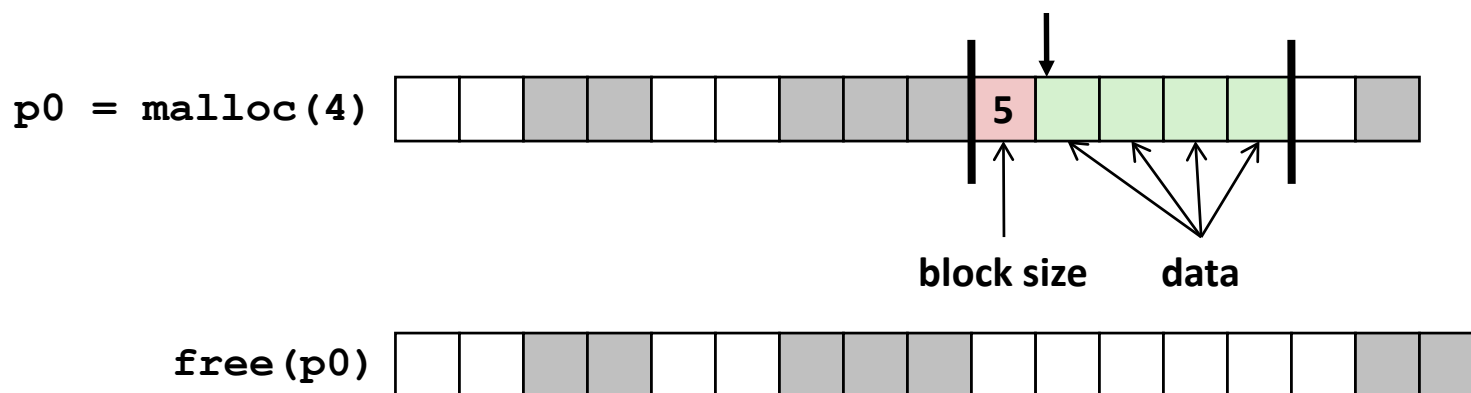

Knowing How Much to Free

■ Standard method

- Keep the length of a block in the word preceding the block.
 - This word is often called the *header field* or *header*
- Requires an extra word for every allocated block

Keeping Track of Free Blocks

- Method 1: *Implicit list* using length—links all blocks

Assignment Project Exam Help

- Method 2: *Explicit pointers* using pointers

- Method 3: *Segregated free list*

- Different free lists for different size classes

- Method 4: *Blocks sorted by size*

- Can use a balanced tree (e.g. Red-Black tree) with pointers within each free block, and the length used as a key
